

Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is actually a tool constructed out of high quality materials meant to withstand the most difficult operations and work environments. This particular piece of equipment can enable the one driving to be able to maneuver the forks hydraulically without leaving the seat. Side shifting units have the extra ability to be able to laterally position the arms or the entire load so as to facilitate more precise lifting and position in a faster and much more effective manner.

The fork pocket is somewhat unique and could enable the person operating it to securely swing the blades into position without any worry of damaging the positioning cylinders. This allows the operator the alternative to be able to perform simultaneous or independent fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into blade positioners on available units.
